

Single-region LP-counterfactual: structural pathology on ImageNet
(linearization breaks before $x + \delta$ reaches the LP optimum; actual logits do not flip)

original (class=207, golden retriever)

$x + \delta$ (would-be counterfactual to class=282)
 $\|\delta\|_1=128.0$, $\|\delta\|_\infty=4.10$, $\|\delta\|_2=18.7$

logit chart — target is supposed to win;
instead source wins (region_ok = False)
